Tessera.

How to tell this story to people who run businesses.

Pitch pack 3 of 4: **the playbook**. The audience, three messages, where the money leaks, a 4-minute run sheet, numbers we can say out loud, and the words to use and avoid.

DATA
Synthetic world, Valentino is demo branding

KNOW THE ROOM

Business people and Fastweb, voting on six criteria

CRITERION	WEIGHT
Completeness & feasibility	40
AI-agent innovation	20
Fit with the challenge	10
Application potential	10
Fastweb tech alignment	10
Presentation	10

What this means for how we talk

- **40% is "does it really work end to end?"** It is also the tie-breaker. Show one path working, from the email to the decision card, rather than ten half-built features.
- **20% is agents.** Show the investigator *choosing* its checks, not just summarising.
- **The rest is believability.** Name a buyer, a pain and a way in. Show that it runs on Fastweb's models.

What the brand told us

Forecast and transaction systems are slow by design and won't change. Stores feel the market first. A stockout costs brand image, not just a sale. **Decide as early as possible, and humans decide.** Short term means moving stock; long term means production, which is far too high-stakes for AI alone.

THREE MESSAGES. REPEAT THEM.

If the jury remembers only three sentences

1

“Stores see it first.”

Value: we catch what sales show a day later, and what sales **never** show: the customer who asked for a size that wasn’t there.

2

“Every claim has a receipt.”

Trust: every line on a card links back to the sentence a store wrote. When the evidence is thin, the system says “verify”, not “buy”.

3

“Options, not orders.”

Adoption: nothing moves without a person. That lowers the risk of trying it: a planner gets an analyst, not a replacement.

OPENING LINE

“Tonight is Thursday. Today’s sales don’t exist yet. And the sale that didn’t happen, because size M ran out, will never exist. But at eight o’clock the store manager wrote it down. We read it.”

THE BUSINESS CASE

Where the money leaks today

Sales you never see

A size runs out and the till records zero. The forecast learns “low demand”, the next allocation shrinks, and the gap feeds itself.

A client who leaves empty-handed

In luxury a stockout also costs brand image: the client who came for a piece and didn’t find it. The brand said so directly.

Stock in the wrong place

Markdowns are rare in luxury, so surplus is expensive too. One store waits for a size while another sits on it.

Moves based on rumours

A forwarded email counted three times, or stock pulled from a store whose “low sales” were really scaffolding at the door.

Hours nobody has

Hundreds of emails a day in 10+ languages. Nobody reads them against stock and sales, so the knowledge stays in inboxes.

Decisions that come too late

Logistics is slow. Every day of warning before the shipping cut-off is what makes an option still possible.

Don’t quote a euro figure. We have no real data, and an invented ROI loses credibility. Offer the frame instead: *value = sizes recovered × full-price margin + wrong moves avoided × cost of a move + analyst hours returned*. Then: “a pilot would measure it on your numbers.”

THE 4-MINUTE RUN SHEET

Each beat carries one business point

TIME	ON SCREEN	SAY	THE POINT
0:00	The case queue, Thursday evening	The opening line. Certified sales come tomorrow; unmet demand never comes.	Stores see it first
0:30	Milan email, sentence highlighted → fact → product	“Two facts: a stockout and demand we can’t count, so we don’t invent a number.”	Every claim has a receipt
1:15	Investigator trace and options with checks	“It can read stock and routes, but it can’t approve. Watch it choose.” Point out the stock mismatch card.	Agent that investigates; options, not orders
2:15	What-if, then a store disruption case	“Raise the forecast and the transfer shrinks. Low sales from scaffolding don’t pull stock away.”	Numbers come from code; context ≠ demand
3:00	Ambiguous “sweatshirt” → question → linked	“When it isn’t sure, it asks the store in its own language.”	Honest by design
3:40	Proof slide, then buyer and path	Two numbers (next page), “synthetic data, measured on stores we tuned on”, then the buyer and the pilot.	It works, and it can be adopted

Full script: docs/demo_script.md. Before you rehearse, check pack 4 for the demo-script issues to fix.

PROOF WE CAN SAY OUT LOUD

Measured on the dev stores of the synthetic world

0 / 43
wrong product links among those accepted. 21% abstained and asked instead.

92%
of product-specific events caught (48 of 52), against 57% by chance. The stock and sales rules did no better than chance.

0.84
precision reading 26 emails in 8 languages. Of the facts we extracted, 84% were right.

≈1 day
earlier than sales or stock when both catch the event: same evening vs next-day certification.

THE STRONGEST EXAMPLE

Some events are seen **only** by Tessera. A **quality defect** reported by all 12 dev stores, mostly on day one. Requests for a colour the store **doesn't carry**. A launch below expectations. No sales or stock rule ever flags these.

SAY IT WITH THE CAVEAT, EVERY TIME

"Synthetic data built for the challenge, with decoys and noise; measured on the stores we developed on. The kept-aside stores are scored once, at the end." Until that run is done, **don't present any hold-out number**.

Sources: EVL-02 (PR #162) and EVL-04 (PR #163) results. Broad, season-wide events are excluded from claims: there, no method beats chance.

VOCABULARY

Words that work, words that backfire

SAY	NOT	WHY
A decision layer on top of your forecast	~~A better forecast~~	Their models are fixed and slow on purpose
Options for a planner to approve	~~Automated transfers~~	Humans decide; it lowers the adoption risk
Earlier, or seen where sales never show it	~~Real time~~	Logistics is slow; the value is the warning
It asks when it isn't sure	~~The AI knows~~	Abstention is our credibility
A synthetic world with decoys and noise	~~Valentino's data~~	It is not, and we were asked not to cite them
Uncertified store signals, kept apart	~~Replaces reporting~~	Certified actuals stay untouched
Reads what stores already write	~~Stores change nothing~~	Optional voice notes are a new habit; adoption is a hypothesis
A pilot would measure it on your numbers	~~ROI of X%~~	No real data, so no real ROI

APPLICATION POTENTIAL

Who buys it, how it gets in, why now

BUYER

HQ allocation and merchandising.

Retail ops, product/quality and marketing get their own view of the same facts. First context: a network of directly operated boutiques. Franchise and multi-brand come later.

PROPOSED PILOT

One region, read-only, the closing emails stores already send. Planners keep their tools and review the queue each morning. We measure decisions taken earlier, cases planners judged useful, and false alarms.

WHY NOW

AI can finally read hurried multilingual text reliably. Vendors are opening their ERPs to agents through a standard connection (MCP), and Tessera already exposes one, read-only. It runs on **Fastweb's AI models**.

CLOSING LINE

Your stores already know. Tessera makes sure headquarters hears them, with the receipt attached.
